

Part Number: 762595

Description: Front Saddle

Fitment: 2017-2021 Suzuki GSX-R 1000

Revision: 1

Tools Required	Parts List
5mm Allen Wrench	

1. Begin by removing the stock seat. Refer to your owner's manual if necessary.

2. Saddle mounts just like stock, using your stock bolts. Simply slip the two rear pegs into the rear chassis, align the front brackets where you removed the stock bolts (*Figure 1*) and secure with the stock bolts.

TROUBLE SHOOTING:

RUBBER BUMPERS: If the seat doesn't slide far enough forward or rearward, it will not line up or latch properly. Apply a little lubricant to the rubber bumpers to allow them to slide easier while engaging the tongue FULLY. A spray lubricant like WD-40 works great for this.

MOUNTING TONGUE: To help get the tongue to slide fully into the bracket, give the saddle a good forward (or rearward) "smack" with your hand to get the tongue to slide fully into the bracket.

It is also possible that due to manufacturing tolerances from bike to bike, a slight bending of the tongue will make it fit your individual bike better. The tongue is made of a mild steel that will bend easily enough with an adjustable wrench clamped on it. Very little bend is needed in most cases, so be careful not to overdo it!

SADDLE POSITION: As we mentioned above, you may think the saddle is slid all the way into place because it stops, but because of the new bumpers it may actually need to slide further. Remember, our basepan doesn't have the flex of the stock model, so it makes getting things in position just a little more difficult. You may have to bump the seat forward with a smack of your hand or actually wiggle it as you slide it into position. The other mounting tabs or latch brackets will not line up if the seat isn't in the right position!
